

Mapal V Rain Gutter

The V Rain Gutter is a must element in the traditional Spanish greenhouse. The main purpose of the VRG (V Rain Gutter) is to collect the run off rainwater and condensation from the roofs of the greenhouse.

This water can then be channeled into the recycling system, re-used or discarded.

The VRG is made of Polypropylene UV treated material that is resistant to all chemicals and acids.

The VRG is offered with a thickness of 700 microns or higher.

The VRG is offered in black & white (the white color is positioned towards the inside of the to the greenhouse, to reflect the light) or in black only.

The dimensions of the VRG are flexible, allowing the greenhouse builder or grower to order the size according to the shape and dimensions of the particular greenhouse construction.

Two of the more used dimensions are 2.5-21-21-2.5 and 2.5-18-18-2.5.
